Choose the operating market first

Cockroach farming: six cities at 39-40 degrees north
Supplement to the business plan | 8 November 2026

Start site diligence in **Tianjin** for a China-focused live-feeder pilot. Compare **Tangshan** if a permitted building and contracted heat supply materially lower costs. In Japan, compare **Morioka for distribution** with **Akita for its milder winter and rice-processing supply leads**. These are screening judgments; none is a confirmed permitted site or a proven profitable market.

City / country	Reference latitude	January mean	Provisional role
Beijing / China	39.93 N	-2.8 C	Sales, buyer development and small technical pilot; check manufacturing restrictions first.
Tianjin / China	39.10 N	-2.6 C	First China shortlist: regional input suppliers and Beijing-Tianjin customer access.
Tangshan / China	39.67 N	-4.6 C	Conditional larger production candidate; require actual heat, premises and transport quotations.
Akita / Japan	39.72 N	+0.4 C	Japan pilot candidate if local input relationships offset delivery costs.
Morioka / Japan	39.70 N	-1.6 C	Japan pilot candidate for regional/national distributor relationships.
Pyongyang / DPRK	39.03 N	-5.1 C	Geographic benchmark only; exclude from ordinary international-investment shortlist.

Latitudes are station/reference coordinates, not a guarantee that every district lies within the band. Confirm the actual parcel coordinate. Tangshan is 39 degrees 40 minutes in the cited climate standard. [C01] [C02] [C03] [C04] [C05] [C06] [C07]

Recommended first comparison: two suitable premises in Tianjin versus two in Tangshan, using the same product specification and paid buyer tests. If the target market is Japan, compare Akita and Morioka separately; do not assume cross-border live-insect sales.

Scope: domestic live feeders, qualified dried/processed products and contracted medicinal raw material. Human food, waste-treatment fees, chitosan and pharmaceutical manufacturing are not included as dependable startup revenue. Country entry, ownership and banking eligibility also depend on the investor, who has not been specified.

City-by-city commercial comparison

City	Permit issue to resolve	Feed supply assessment	Market access / strategy
Beijing	Local feed-licensing guidance explicitly checks industrial restrictions. Confirm the plot and activity before lease.	Source certified maize, soybean meal and compounded diets from the wider North China supply chain. City production is not needed to access it.	Use Beijing for buyer interviews and specialist-shop/distributor contacts. Large pet exhibition is a lead, not proof of feeder volumes.
Tianjin	Confirm live-feeder classification with district/city agriculture authority. Processing may trigger feed licensing and environmental requirements.	Port-area grain/oil processing gives supplier leads for meal and cereal inputs. Small orders still need delivered quotations.	Prioritize Beijing-Tianjin distribution and domestic contracts. Port access does not clear exports or live-insect shipping.
Tangshan	Hebei provincial feed authority plus local land, building and environmental routing. No special cockroach clearance verified.	Use Hebei maize/soymeal suppliers; seek feed-grade, traceable by-products. Industrial heat is a negotiation opportunity, not assumed free supply.	Consider production serving the same regional buyers as Tianjin. Favor it only if premises/heat savings exceed extra logistics and quality costs.
Akita	Japan product-use classification; Akita prefectural feed contact for covered feeds. Municipal premises and waste handling remain site-specific.	Rice-mill bran and broken-rice sourcing leads; stabilize/test bran and add a balanced protein source. No free-feed assumption.	Domestic specialty feeder channel. Lower heat load, but test winter collection and distant-market delivery before expansion.
Morioka	Same national framework as Akita; Iwate has official manufacturer/importer/seller forms.	Iwate feed-manufacturing base offers compound-feed supply leads. Regional supplier presence is not a small-lot price guarantee.	Tohoku road/freight connections favor a distributor-led model. Carrier acceptance and live-arrival performance must be confirmed.
Pyongyang	UN restrictions materially constrain international joint ventures and finance. Domestic permitting not established here.	No reliable delivered feed quote or dependable supply contract verified.	Do not budget commercial entry or export revenue. Treat as an excluded investment case unless lawful feasibility is independently established.

Permit evidence: [C12] [C13] [C16] [C17] [C18] [C20] Supply and access evidence: [C21] [C22] [C23] [C24] [C25] [C26] [C27]

Winter heating: comparable quantities

The following estimates isolate **sensible space heating for one insulated 100 m2 breeding room**, maintained at 28 C. They are calculated scenarios, not measured farm utility bills. January has 31 days; winter is December-February, 90 days.

City	Dec / Jan / Feb mean C	January electricity kWh	Winter electricity kWh
Beijing	-1.0 / -2.8 / +0.6	1,389	3,812
Tianjin	-0.7 / -2.6 / +0.8	1,380	3,781
Tangshan	-2.6 / -4.6 / -0.9	1,470	4,026
Akita	+2.8 / +0.4 / +0.8	1,244	3,488
Morioka	+0.8 / -1.6 / -0.9	1,335	3,738
Pyongyang	-2.8 / -5.1 / -2.3	1,492	4,115

Climate inputs: [C01] [C02] [C03] [C04] [C05] [C06]. Tangshan uses the local 1999-2018 series; the other cities use JMA published normals. Reference periods and stations differ, so small city-to-city differences should not be treated as precise rankings.

City	January variable heating cost	Dec-Feb variable heating cost
Beijing	CNY 833-1,389	CNY 2,287-3,812
Tianjin	CNY 828-1,380	CNY 2,269-3,781
Tangshan	CNY 882-1,470	CNY 2,416-4,026
Akita	JPY 31,110-43,553	JPY 87,206-122,088
Morioka	JPY 33,364-46,710	JPY 93,445-130,823
Pyongyang	Not priced	Not priced

Price assumptions: China CNY 0.60-1.00/kWh; Japan JPY 25-35/kWh. China values are planning bands, not verified city tariffs. Japan values bracket a published tariff benchmark discussed next. Basic/demand charges, fans, moisture control, drying, backup energy and taxes not already included in the selected rate must be added. No DPRK price is invented.

What the comparison means

At identical efficiency, Akita uses 6.8% less January heating electricity and 6.7% less winter heating electricity than Morioka. Its January saving at JPY 25.33/kWh is only about JPY 2,284 per 100 m2. A small difference in rent or shipment losses can reverse the location decision.

Heating assumptions and tariff checks

Model input	Assumption / calculation
Room and envelope	100 m2 floor area; 300 m3 volume; effective exposed envelope 340 m2; average U-value 0.30 W/m2 K.
Ventilation	0.5 air changes/hour; no heat recovery credited. Required air exchange must be validated at actual insect density and moisture load.
Heat-loss coefficient	0.30 x 340 + 0.33 x 0.5 x 300 = 151.5 W/K.
Heat pump	Constant coefficient of performance (COP) 2.5: 2.5 kWh heat per 1 kWh electricity. This is a comparison assumption, not a cold-weather guarantee.
Monthly formula	Electricity kWh = 151.5 x (28 - monthly mean C) x 24 x days / 1,000 / 2.5.
Full cost	Variable heating kWh x applicable delivered rate + allocated basic/demand charge + other utilities.

Published Japan benchmark

The opened Tohoku low-voltage power page lists JPY 26.99/kWh for the other season and JPY 1,400.90 per contracted kW-month. The published December 2026 adjustment is -JPY 5.84/kWh; the 2026 renewable surcharge is +JPY 4.18/kWh. Together, the illustrative variable rate is **JPY 25.33/kWh**. Eligibility and the billing month must match the actual contract. [C08] [C09] [C10]

At that benchmark, modeled January heating is JPY 31,520 in Akita and JPY 33,804 in Morioka. If a separate eligible 5 kW connection is assumed, its undiscounted basic charge adds JPY 7,005/month, giving approximately JPY 38,525 and JPY 40,809. This illustrative connection size is not an equipment specification; do not allocate the same basic charge twice.

China: obtain a delivered tariff, not a purchase component

Request the correct Beijing, Tianjin or Jibei-grid contract for the parcel: voltage, time-of-use periods, transmission/distribution and system charges, funds, capacity/demand charges and landlord resale terms. Beijing's official 2026 arrangements include direct market and grid-agency purchasing. The commodity purchase price alone is not the final bill. [C11]

Stress test the building before choosing the city

COP 2.0 raises modeled electricity by 25%; resistance heating at COP 1.0 raises it by 150%. An envelope U-value of 1.0 with one air change/hour gives 439 W/K, approximately 2.90 times the modeled heat loss. Combining that envelope with resistance heating costs about 7.24 times the insulated heat-pump case at the same tariff.

Size heating for local design extremes, not monthly averages. Obtain cold-weather capacity/COP curves and a power-failure response. For 1,000 m2 arranged as ten identical rooms, ten times the table is a transparent screening estimate; a shared envelope may reduce losses. Use measured moisture and occupancy loads in final engineering.

China: permits follow the product

I did not establish a single universal cockroach-farming permit that clears every use. A farm registration, a feed-production licence and authorization for a medicinal ingredient are separate questions. Secure a written classification for the scientific species name, feed substrate, process and intended buyer before construction.

Activity	Required determination / likely route	First authority to approach
Domestic live feeder or breeding-stock sales	Ask whether the stated species/activity requires agricultural, animal-health or other approvals; confirm lawful stock origin and containment. Business registration alone is not proof of product clearance.	District agriculture/rural affairs; market regulation; relevant species/import authority if needed.
Dried insects or meal sold as feed	Confirm current catalogue coverage and recipient animals; establish whether the output is a licensed single-feed product or another category. Apply hygiene, labels and traceability requirements.	Beijing/Tianjin municipal or Hebei provincial feed authority; current delegated local window.
Medicinal raw material	Obtain a manufacturer-approved species, source, feed and processing specification, qualified supplier agreement and applicable GAP controls. No therapeutic manufacturing authorization follows from farm ownership.	Provincial drug authority and the licensed purchasing manufacturer.
Food-waste treatment or frass sales	Determine waste-receiving/processing and environmental requirements separately; classify any fertilizer product. No waste fee or frass income is assumed.	Local ecology/environment, sanitation/waste and agriculture authorities as applicable.
All sites	Check permitted land/building use, fire design, drainage, odor/noise, waste disposal and project environmental classification for actual scale and equipment.	Local planning/natural resources, construction/fire and ecology/environment offices.

National feed-production licences are issued by provincial-level authorities under the cited rules. Medicinal animal raw-material GAP follows a distinct framework. [C13] [C29]

A material Beijing disadvantage for production

Beijing’s feed-licensing page expressly states that applications violating its prohibited/restricted new-industry catalogue will not be handled. This makes activity and site screening an early gate. It does not prove that every live-insect farm is banned. For Tianjin or Tangshan, no comparable site clearance has been obtained; proximity to an industrial estate does not itself grant approval. [C12]

Current feed catalogue: avoid a false yes or no

The May 2026 compilation contains generic insect-meal entries conditional on public and animal health. MARA amended the catalogue in June 2026. The amendment notice was verified, but its OFD attachment could not be retrieved and a cockroach-specific determination was not established. Therefore, do not infer either blanket approval or a blanket ban from the generic wording. Request the current consolidated entry and its application to the proposed species and product. [C14] [C15]

Japan and DPRK: different entry routes

Akita and Morioka: classify the receiving animal

Japan's Feed Safety Act notification system covers feeds for listed livestock and aquatic species; the MAFF list does not include reptiles. For covered activities, manufacturing/importing/selling notifications are generally due **two weeks before starting**, via the relevant prefectural route. This is a filing deadline, not an overall farm-approval timetable. [C16]

Dog/cat pet food has a separate safety and notification framework. A live cockroach intended for a reptile should not automatically be treated as dog/cat food or as a livestock-feed ingredient. Obtain a product-use ruling, then check applicable general business, land/building, waste, nuisance and species rules. [C19]

City	Practical permit contacts	Evidence still needed
Akita	Akita prefectural livestock promotion division for covered feeds; city building/environment departments for the premises. FAMIC directory lists the prefectural routing.	Current classification of live B. dubia; intended substrate; building-use acceptance; waste destination and shipping contract.
Morioka	Iwate prefectural livestock division and the responsible livestock hygiene centre. Iwate publishes manufacturer, importer and seller forms.	Same product/site evidence; confirm whether the local centre or prefecture receives the filing for the business structure.

Contact routing sources: [C17] [C18]. The FAMIC contact list is dated April 2023; verify the current office before submission.

Breeding-stock imports are a separate decision

MAFF distinguishes plant-pest insects from non-pest insects for plant quarantine. That distinction alone does not clear a particular cockroach import under all laws. Submit the scientific name, origin and quantity to the relevant authorities; use documented domestic stock when lawful and feasible. An online listing is evidence of trading activity, not an import authorization. [C28]

Pyongyang: exclude from the ordinary investment shortlist

UN measures prohibit opening, maintaining or operating joint ventures/cooperative entities with DPRK entities or individuals, subject to specified exceptions and Committee approval. Banking and financial restrictions add separate obstacles. Those constraints are material for an international project regardless of biological feasibility. [C20]

The climate can be compared, but a reliable commercial electricity tariff, feed quotation, buyer channel and farm-permit route were not verified. I therefore assign no profitability estimate and recommend no commercial commitment. A wholly domestic project would require its own legal and operating evidence; no workaround is proposed.

Feed: compare delivered, usable inputs

Location	Supplier-search priorities	Constraint to price explicitly
Beijing	Licensed regional distributors and mills supplying standard, unmedicated diets; source from Hebei/Tianjin if appropriate.	Delivery minimums and freight may erase any factory-price advantage. Avoid paying city premises costs just to be near feed.
Tianjin	Port-region grain/oil processors and feed mills; seek maize products, wheat bran and soybean meal with lot documentation.	Large processors may not serve small batches. Confirm commodity grade, storage, pesticide/mycotoxin tests and stable delivery.
Tangshan	Hebei maize/soymeal distributors and local mills; obtain the same specification as Tianjin for a fair comparison.	Provincial prices are benchmarks, not farm quotations. Cost in grinding/mixing, losses and truck quantities.
Akita	Rice mills/JA channels for stabilized bran or broken rice plus protein and mineral ingredients.	Bran can oxidize and varies in moisture/contamination. Regional rice output is not available feed supply.
Morioka	Iwate compound-feed suppliers; Kamaishi Feed appears in FAMIC's GMP-confirmed site list.	Kamaishi is a regional sourcing lead, not a Morioka supplier quote or a validated cockroach-feed formulation.
Pyongyang	No bankable supplier evidence established.	Do not assign an input cost or assume food by-products are freely available.

Input-chain evidence: Tianjin reports CNY 33.92 billion in grain/oil processing output value for 2025. Akita's 2026 agricultural overview attributes 64.2% of 2024 agricultural output value to rice. Both are sourcing signals, not quantities allocated to insect farming. [C22] [C23] [C24]

A dated North China feed-price benchmark

Hebei, week 41 of 2026	CNY/kg	Use in procurement
Maize	2.33	Energy-ingredient comparison
Soybean meal	3.35	Protein-ingredient comparison
Broiler complete feed	3.61	Reference for a complete diet; check medication/additives
Layer complete feed	2.85	Price reference only; calcium and nutrient profile may be unsuitable

Official provincial observation published 16 October 2026. [C21] These are not delivered quotations for Beijing/Tianjin/Tangshan or a recommended cockroach recipe. No comparable Japanese delivered price was verified; obtain like-for-like small-lot and bulk offers before selecting a site.

For every feed, compare cost per kilogram of dry matter and per saleable insect, including freight, processing, rejection and storage. Run controlled feed trials. The lowest-price ration is unattractive if it reduces breeder output or increases mortality.

Market access and scale strategy

Treat retail channels and industrial buyers separately

Beijing's official 2026 pet-exhibition listing identifies a place to build trade contacts. Japan's Charm listing demonstrates an existing live-Dubia retail channel, with dead-on-arrival risk visible in the listing. Neither source establishes the addressable market, wholesale price or sales volume for a new farm. [C25] [C27]

Product route	Preferred city logic	Commercial gate
Live reptile feeders	Tianjin for a China pilot; Beijing for customer development. Morioka or Akita for domestic Japanese distribution.	At least three repeat buyers, verified carrier acceptance, measured arrival losses and positive order contribution.
Breeding stock	Add only after building a reliable colony and records; any shortlisted lawful site.	Traceable age/sex/species, buyer support and genuine end-user demand. Do not base the business on recruiting new breeders.
Medicinal raw material	China sites only after a qualified manufacturer accepts the supplier/process.	Paid sample acceptance, specifications, contracted volumes and price. None of the three cities has a verified purchasing commitment.
Livestock/aquaculture meal	A permitted industrial site near feed and process utilities; Tangshan/Tianjin worth quoting.	Species/product regulatory confirmation plus delivered-cost competitiveness; do not assume commodity feed prices cover drying.
Waste service, frass or specialty extracts	Separate partner-led projects, not automatic add-ons.	Separate approvals, validated residues/process, and a paying customer. Zero base-case revenue.

Choose the scale after validating delivery economics

Small: one contained breeding room serving paid, repeat feeder orders. Test winter heating and shipments. **Medium:** modular rooms added only when proven customer contribution pays for staff, premises and winter utilities. **Large:** require firm raw-material offtake, independent engineering, product approval and a heat-supply/backup agreement; a port or factory cluster is not enough.

Morioka's city transport plan documents expressway, national-road and freight-terminal links. That supports its distribution shortlist, but passenger journey times and general freight connections do not establish safe live-insect transit. Test actual parcel routes, packing, weekends, collection cutoffs and cold-weather rejection rules. [C26]

Market-access test: net collected price minus feed, labor, packaging, freight, arrival losses, refunds and sales fees must remain positive. Use local-currency customer quotes. Do not infer Japanese profitability from a US feeder price or Chinese profitability from a pharmaceutical retail price.

Site diligence and final selection

Recommended order of work

Stage	Action	Evidence required to proceed
Week 1	Contact the appropriate authorities with species, substrate, process, intended buyer and two candidate addresses.	Written classification and the applicable permit/filing list; verify each parcel lies between 39 and 40 N.
Weeks 1-2	Request matched premises, feed and utility quotations.	Permitted use; envelope/ventilation information; 12 months of comparable bills; full tariff; power capacity; three delivered feed quotes.
Weeks 2-4	Interview buyers and run paid small shipment tests.	Required grade/count, net price, repeat demand, carrier acceptance, time in transit and arrival-loss costs.
First winter	Instrument a contained room and trial feeds/cohorts.	Temperature, electricity, ventilation/moisture, growth, breeder output, mortality, labor and cost per saleable unit.
Before expansion	Review contracts, cash flow and technical performance.	Required approvals, repeat orders and a funded downside case. Large lines also need qualified processing/offtake contracts.

A decision rule that avoids choosing by cheap heat alone

Apply legal feasibility and landlord/building acceptance as pass/fail gates. Then rank actual sites using: realized buyer contribution 35%, premises/labor 25%, delivered feed 15%, total utilities 15%, and logistics/resilience 10%. These weights are a proposed management tool, not an empirical score; do not assign numerical city scores without quotations and paid demand tests.

Conditional recommendation

China: start with Tianjin; keep Tangshan as the production alternative if lower premises/heat costs survive written quotes and extra freight. Use Beijing primarily to develop buyers and technical relationships, with any local production subject to industrial/site checks. **Japan:** choose Morioka if its actual collection/delivery economics are better; choose Akita if supplier relationships, premises and lower heat costs compensate. **Pyongyang:** exclude from the ordinary international-investment shortlist.

The original plan’s USD investment cases remain scenarios, not local quotations. This supplement refines geography and space-heating assumptions; it does not replace the full facility energy budget. Before committing capital, rebuild the cash forecast in CNY or JPY, with wages, rent, freight, taxes, product approval and actual selling prices for the chosen site.

No city is investment-ready from desk research alone. The next useful commitment is a small, permitted validation room supported by paid buyer tests, followed by a measured winter. City selection is complete when the specific site and product economics pass these gates.

Sources and verification notes

Checked 8 November 2026. Links identify the underlying source; observations, calculated scenarios and location judgments are distinguished in the text. The report is a site-screening supplement, not a local permit determination.

C01 JMA: Beijing climate normals and station coordinates
January -2.8 C, February 0.6 C, December -1.0 C; latitude 39.93 N.

C02 JMA: Tianjin climate normals and station coordinates
January -2.6 C, February 0.8 C, December -0.7 C; latitude 39.10 N.

C03 Tangshan High-tech Zone: Jingtang Smart Port planning environmental assessment
Printed page 190, PDF page 198: 1999-2018 station observations; January -4.6 C, February -0.9 C, December -2.6 C. Different reference period from JMA normals.

C04 JMA: Akita climate normals and station coordinates
January 0.4 C, February 0.8 C, December 2.8 C; latitude 39.72 N.

C05 JMA: Morioka climate normals and station coordinates
January -1.6 C, February -0.9 C, December 0.8 C; latitude 39.70 N.

C06 JMA: Pyongyang climate normals and station coordinates
January -5.1 C, February -2.3 C, December -2.8 C; latitude 39.03 N.

C07 Beijing planning authority: DB11/938-2022 climate tables
Tangshan station latitude 39 degrees 40 minutes, approximately 39.67 N.

C08 Tohoku Electric Power: low-voltage power tariff
Live page checked 8 November 2026: other-season energy JPY 26.99/kWh and basic charge JPY 1,400.90/kW-month. Search snippets showed older prices; the opened page was used.

C09 Tohoku Electric Power: December 2026 fuel and island adjustments
Published before this report: net adjustment -JPY 5.84/kWh. December billing benchmark, not a fixed January forecast.

C10 METI: 2026 renewable-energy surcharge
JPY 4.18/kWh applies from May 2026 through April 2027 meter readings.

Sources and verification notes

Checked 8 November 2026. Links identify the underlying source; observations, calculated scenarios and location judgments are distinguished in the text. The report is a site-screening supplement, not a local permit determination.

C11 Beijing government: 2026 electricity-market arrangements
Market contracting and grid agency purchasing apply; actual delivered prices depend on contract and time of use.

C12 Beijing government service: feed-production licensing
Beijing Agriculture and Rural Affairs Bureau; eligibility explicitly refers to the 2022 prohibited/restricted new-industry catalogue.

C13 MARA: feed and feed-additive production licensing rules
Consolidated rules revised in 2022. Provincial-level feed authorities issue licences; classification of the specific product remains necessary.

C14 National Animal Husbandry Service compilation: feed-material catalogue, May 2026
Page 63 of the PDF has conditional generic insect-meal categories. This version precedes the June amendment and cannot establish current species approval alone.

C15 MARA Announcement 1028: June 2026 catalogue amendment
Official announcement dated 4 June 2026. The OFD attachment could not be retrieved; no cockroach-specific approval is inferred.

C16 MAFF: Feed Safety Act questions and answers, updated 30 March 2026
Defines covered recipient animals and advance business notifications. Reptiles are not included in the listed recipient species.

C17 FAMIC: feed-business notifications and prefectural contacts
Contact directory is dated April 2023; verify current routing. Iwate: prefectural livestock division/local livestock hygiene centre; Akita: livestock promotion division.

C18 Iwate Prefecture: feed-business notification forms
Official manufacturer/importer/seller forms; Central Livestock Hygiene Service Centre provides the local contact route.

C19 MAFF: pet-food safety procedures
Dog/cat pet-food manufacturing and importing use a separate notification route. Reptile feeder sales should not be equated with dog/cat food.

C20 United Nations Security Council: DPRK sanctions measures
Joint ventures/cooperative entities with DPRK entities or individuals are prohibited under Resolution 2375, subject to stated exceptions/Committee approval; financial restrictions also apply.

Sources and verification notes

Checked 8 November 2026. Links identify the underlying source; observations, calculated scenarios and location judgments are distinguished in the text. The report is a site-screening supplement, not a local permit determination.

C21 Hebei Animal Husbandry Station: week 41 of 2026 feed prices
Published 16 October: maize CNY 2.33/kg, soybean meal 3.35, broiler complete feed 3.61, layer complete feed 2.85. Provincial benchmarks, not delivered farm quotations.

C22 Tianjin Port Free Trade Zone: 2025 economic results
Reports 2025 grain/oil processing output value of CNY 33.92 billion; evidence of an input-processing cluster, not available cockroach feed tonnage.

C23 MAFF: 2026 overview of Akita agriculture
Rice accounts for 64.2% of 2024 agricultural output value; rice milling is a sourcing lead, not proof of cheap or available bran.

C24 FAMIC: feed-manufacturing sites with GMP conformity confirmation
Lists Kamaishi Feed in Iwate. A potential regional supplier to approach, not a confirmed seller of suitable cockroach diets.

C25 Beijing Commerce Bureau: 2026 international pet-products exhibition
Scheduled 19-22 March 2026; indicates trade-network access, not reptile-feeder demand or purchase commitments.

C26 Morioka City: agriculture and logistics transport-network plan
Describes Tohoku Expressway, Route 4 and Morioka freight-terminal connections. Does not establish live-insect courier acceptance.

C27 Charm retailer: live Dubia product listing in Japan
Seller listing for 50 large live Dubia; title disclaims dead-on-arrival compensation. Evidence of a retail channel, not wholesale farm-gate pricing.

C28 MAFF Plant Protection Stations: import scope
Plant-pest insects and non-pest insects have different plant-quarantine treatment; exact species and other laws still require confirmation.

C29 China: 2022 GAP for traditional Chinese medicinal materials
Primary joint-agency legal text hosted by FAO. Medicinal animal raw materials have a separate quality and traceability route.
